

ALsapPM™
Enterprise Series

- Leverage Palm Computing® products with a fully functional and proven business solution. ALsapPM offers your organization a competitive advantage by decreasing operating costs and eliminating conventional methods of tracking plant maintenance information.
- **IK11 Transactions**
- ALsapPM's design centers on the idea that tracking and reporting Measurement Documents (IK11 transactions) can be made easy. The user records detailed equipment performance by tapping the prompts displayed on the personal digital assistant (PDA) screen. This process is so intuitive that users do not have to be technical to operate the tool. Just as important, electronic communication of IK11 transactions to SAP Plant Maintenance can be performed in a cost-effective manner. The goal is to process detailed equipment measurement points electronically with state-of-the-art technology that will transform a cumbersome process into an accurate, efficient and timely operation.
- Most organizations undergo a labor-intensive process gathering equipment performance reports from the field. The data is typically collected manually on a form or equipment report. Final entry into SAP Plant Maintenance is subject to transcription, translation, and transposition errors. Mistakes usually result from illegible handwritten documents, miscoding, and time constraints in reporting and data entry. Eliminate many of these issues with a handheld application that uses data integrity to enforce your organization's business rules. It offers one point of entry and provides integration with SAP Plant Maintenance.
- This business application is tailored to ease the burden and reduce the costs of tracking and costing production at all levels of an organization. Therefore, company management operates in a more productive environment enabling better business decisions.
